TITLE : ELECTRIC CONNECTOR

ABSTRACT : PROBLEM TO BE SOLVED: To provide a superb electric connector whose conductive contact has scarcely any impurities adhered, even with tens of hundred times of repetitive contacts (insertion/removal) of an electric contact point of a first connector with a conductor of a second connector.

SOLUTION: With the electric connector 1 with which, a first connector 10 and a second connector are detachably confronted, and a plurality of electric contact points 12 of one side of the first connector are connected with a plurality of electric contacts 30 of one side the second connector, where, an electric contact is provided on a conductor 26 of a substrate 22 of the second connector and slit-shaped cut-in parts 24 are provided on the substrate around the conductor, at least one conical-head bulge 31 is provided on the electric contact. Further, the conical-head bulges are arrayed in parallel with the sliding direction of the electric contacts. After a slit is cut in a protective coating layer of the second connector in parallel with the sliding direction of the electric contact, it is gradually made to protrude in a conical shape by plating to make up a conical-head bulge.
